

TECHNICAL MANUAL

# In Vitro Proliferation and Differentiation of Human Neural Stem and Progenitor Cells Using NeuroCult™ or NeuroCult™-XF

## Table of Contents

<b>1.0</b>	<b>Materials, Reagents, and Equipment</b>	<b>1</b>
1.1	NeuroCult™ NS-A Proliferation and Differentiation Kits	1
1.2	NeuroCult™-XF Proliferation Medium (Catalog #05761)	1
1.3	Additional Required Reagents and Cultureware	2
1.3.1	Proliferation of Neural Stem and Progenitor Cells	2
1.3.2	Differentiation of Neural Stem and Progenitor Cells	2
1.3.3	Immunolabeling Differentiated Cells	3
1.4	Equipment	3
<b>2.0</b>	<b>Preparation of Materials and Reagents</b>	<b>4</b>
2.1	For Proliferation of Neural Stem and Progenitor Cells	4
2.1.1	EGF Stock Solution (10 µg/mL)	4
2.1.2	bFGF Stock Solution (10 µg/mL)	4
2.1.3	Complete NeuroCult™ Proliferation Medium	4
2.1.4	Complete NeuroCult™-XF Proliferation Medium	5
2.1.5	Coating Cultureware for Adherent Monolayer Cultures	6
2.2	For Differentiation of Neural Stem and Progenitor Cells	7
2.2.1	Preparation of Complete NeuroCult™ Differentiation Medium	7
2.2.2	Suggested Preparation for Xeno-Free Differentiation Medium	7
2.2.3	Coating Cultureware for Differentiation Cultures	8
<b>3.0</b>	<b>Expansion of Neural Stem and Progenitor Cells in Neurosphere Cultures</b>	<b>10</b>
3.1	Background	10
3.2	Initial Plating of Primary Human CNS Cells in Neurosphere Cultures	10
3.3	Passaging Cells from Neurosphere Cultures	11
<b>4.0</b>	<b>Expansion of Neural Stem and Progenitor Cells in Adherent Monolayer Cultures</b>	<b>13</b>

\* NeuroCult™ media is sold under license from StemCells California, Inc. US Patent Nos. 5,750,376; 5,851,832; 5,980,885; 5,968,829; 5,981,165; 6,071,889; 6,093,531; 6,103,530; 6,165,783; 6,238,922

PRODUCTS ARE FOR RESEARCH USE ONLY AND NOT INTENDED FOR HUMAN OR ANIMAL DIAGNOSTIC OR THERAPEUTIC USES UNLESS OTHERWISE STATED. FOR ADDITIONAL INFORMATION ON QUALITY AT STEMCELL, REFER TO [WWW.STEMCELL.COM/COMPLIANCE](http://WWW.STEMCELL.COM/COMPLIANCE).

## 1.0 Materials, Reagents, and Equipment

### 1.1 NeuroCult™ NS-A Proliferation and Differentiation Kits

For component storage and stability information, refer to the Product Information Sheet for each kit, available at [www.stemcell.com](http://www.stemcell.com) or contact us to request a copy.

#### NeuroCult™ NS-A Proliferation Kit (Human; Catalog #05751)

COMPONENT NAME	COMPONENT #	SIZE
NeuroCult™ NS-A Basal Medium (Human)	05750	450 mL
NeuroCult™ NS-A Proliferation Supplement (Human)	05753	50 mL

#### NeuroCult™ NS-A Differentiation Kit (Human; Catalog #05752)

COMPONENT NAME	COMPONENT #	SIZE
NeuroCult™ NS-A Basal Medium (Human)	05750	450 mL
NeuroCult™ NS-A Differentiation Supplement (Human)	05754	50 mL

### 1.2 NeuroCult™-XF Proliferation Medium (Catalog #05761)

For component storage and stability information, refer to the Product Information Sheet for each kit, available at [www.stemcell.com](http://www.stemcell.com) or contact us to request a copy.

COMPONENT NAME	COMPONENT #	SIZE
NeuroCult™-XF Basal Medium	05760	450 mL
NeuroCult™-XF Proliferation Supplement	05763	50 mL

## 1.3 Additional Required Reagents and Cultureware

### 1.3.1 Proliferation of Neural Stem and Progenitor Cells

- Human Recombinant EGF (100 µg, Catalog #78006.1)
- Human Recombinant bFGF (10 µg, Catalog #78003.1)
- Heparin Solution\* (Catalog #07980)
- Bovine serum albumin (BSA) or human serum albumin (HSA) (required for reconstitution of EGF and bFGF)
- Poly-D-Lysine (Sigma Catalog #P7280) [optional; only needed for adherent cultures]
- Laminin (Sigma Catalog #L2020) [optional; only needed for adherent cultures]
- ACCUTASE™ (Catalog #07920) [optional; for passaging cells]
- Trypan Blue (Catalog #07050)

**Table 1. Recommended Cultureware for Proliferation (Neurosphere and Adherent Monolayer Methods)**

CULTUREWARE	RECOMMENDED SUPPLIERS
6-Well Plate	Costar® 6-Well Flat-Bottom Plate, Tissue Culture-Treated (STEMCELL Catalog #38015)
T-25 cm <sup>2</sup> Flask	Nunc™ EasYFlasks™ Nunclon™ (Nunc Catalog #156367 or VWR Catalog #15708-130) Corning® Cell Culture Flask (Corning Catalog #430639 or VWR Catalog #29186-010)
T-75 cm <sup>2</sup> Flask	Corning® Cell Culture Flask (Corning Catalog #3276 or Fisher Scientific Catalog #07-200-66)

### 1.3.2 Differentiation of Neural Stem and Progenitor Cells

- 12 mm round glass coverslips (Carolina Biological Catalog #633029) [optional]
- Corning® Matrigel®, Growth Factor Reduced (Corning Catalog #354277 or #354230) [optional]

**Table 2. Recommended Cultureware for Differentiation**

CULTUREWARE	RECOMMENDED SUPPLIERS
24-Well Plate	Costar® 24-Well Flat-Bottom Plate, Tissue Culture-Treated (STEMCELL Catalog #38017)
Corning® Matrigel®-Coated 24-Well Plate	Corning® BioCoat™ Matrigel™ Matrix 24-Well Plates (Corning Catalog #354605)

\*Heparin solution contains animal-derived components. To provide a complete xeno-free system, heparin can be omitted.

PRODUCTS ARE FOR RESEARCH USE ONLY AND NOT INTENDED FOR HUMAN OR ANIMAL DIAGNOSTIC OR THERAPEUTIC USES UNLESS OTHERWISE STATED. FOR ADDITIONAL INFORMATION ON QUALITY AT STEMCELL, REFER TO [WWW.STEMCELL.COM/COMPLIANCE](http://WWW.STEMCELL.COM/COMPLIANCE).

### 1.3.3 Immunolabeling Differentiated Cells

- D-PBS (Without Ca<sup>++</sup> or Mg<sup>++</sup>) (PBS; Catalog #37350)
- 4% Paraformaldehyde (in PBS pH 7.2; Sigma Catalog #P6148)
- Triton™ X-100 (Sigma Catalog #T-9284)
- Mounting medium (e.g. FluorSave™ Reagent, EMD Millipore Catalog #345789)
- Neural lineage-specific primary antibodies and secondary detection antibodies (Catalog #05716)

## 1.4 Equipment

- Biohazard safety cabinet certified for Level II handling of biological materials
- 37°C incubator with humidity and gas control to maintain > 95% humidity and an atmosphere of 5% CO<sub>2</sub> in air
- Benchtop centrifuge
- Vortex
- Pipette-aid
- Pipettors: 10 µL (Catalog #38061), 200 µL (Catalog #38059), and 1 mL (Catalog #38058) with sterile disposable plastic pipette tips
- Conical tubes, 15 mL polypropylene (Catalog #38009)  
OR
- Round-bottom tubes, 17 x 95 mm, 14 mL polystyrene (Catalog #38008)
- Conical tubes, 50 mL polypropylene (Catalog #38010)
- Hemocytometer
- Forceps for use in moving coverslips during immunolabeling
- Routine light microscope for hemocytometer cell counts
- Inverted microscope with total magnification of approximately 20 - 30X, 80X, and 125X

## 2.0 Preparation of Materials and Reagents

Use sterile technique when preparing materials and reagents.

### 2.1 For Proliferation of Neural Stem and Progenitor Cells

#### 2.1.1 EGF Stock Solution (10 µg/mL)

*Note: If a xeno-free preparation of EGF is desired, substitute HSA for BSA in step 1.*

1. Add 1 mL sterile water containing at least 0.1% BSA to EGF (100 µg/vial) by pipetting the solution down the sides of the vial. Do not vortex.

*Note: If not used immediately, store 100 µg/mL EGF at -20°C to -80°C for up to 6 months.*

2. Dilute EGF (100 µg/mL) 1 in 10 with sterile water containing at least 0.1% BSA (final concentration 10 µg/mL).
3. Store aliquots (0.1 - 0.3 mL) of 10 µg/mL EGF stock solution at -20°C. Do not freeze/thaw each vial more than 3 times.

#### 2.1.2 bFGF Stock Solution (10 µg/mL)

*Note: If a xeno-free preparation of bFGF is desired, substitute HSA for BSA in step 1.*

1. Add 1 mL sterile water containing at least 0.1% BSA to bFGF (10 µg/vial) by pipetting the solution down the sides of the vial. Do not vortex.
2. Store aliquots (0.1 - 0.3 mL) of 10 µg/mL bFGF stock solution at -20°C. Do not freeze/thaw each vial more than 3 times.

#### 2.1.3 Complete NeuroCult™ Proliferation Medium

1. Thaw bottles of NeuroCult™ NS-A Proliferation Supplement (Human) overnight at 2 - 8°C or for 1 - 2 hours at 37°C. NeuroCult™ NS-A Proliferation Supplement can be aliquoted into 10 mL volumes and stored at -20°C until required for use. Repeated thawing and freezing is not recommended.

*Note: If the supplement thaws during shipping, it should be aliquoted immediately. Providing the supplement remains cool (not more than ~10°C), performance should be unaffected.*

2. Add the entire volume (50 mL) of NeuroCult™ NS-A Proliferation Supplement (Human) to 1 bottle (450 mL) of NeuroCult™ NS-A Basal Medium (Human).

OR

Add 1 mL NeuroCult™ NS-A Proliferation Supplement (Human) to each 9 mL of NeuroCult™ NS-A Basal Medium (Human).

3. Mix thoroughly. NeuroCult™ Proliferation Medium without cytokines is now ready for use.

*Note: NeuroCult™ Proliferation Medium without cytokines is only used in specific steps in the procedure, e.g. when resuspending and washing cell suspensions. Do not use this cytokine-free medium for cell culture.*

*After NeuroCult™ NS-A Proliferation Supplement has been added to NeuroCult™ NS-A Basal Medium, store at 2 - 8°C for up to 1 month. Avoid repeated exposure of medium to room temperature and light.*

4. To each 10 mL NeuroCult™ Proliferation Medium without cytokines, add the following:
  - 20 µL of 10 µg/mL EGF (to give a final concentration of 20 ng/mL EGF)
  - 10 µL of 10 µg/mL bFGF (to give a final concentration of 10 ng/mL bFGF)
  - 10 µL of Heparin Solution (to give a final concentration of 0.0002% Heparin (w/v); equals 2 µg/mL)

This will be known hereafter as **Complete NeuroCult™ Proliferation Medium**.

*Note: If not used immediately, store Complete NeuroCult™ Proliferation Medium (cytokine-containing) at 2 - 8°C for up to 2 week.*

### 2.1.4 Complete NeuroCult™-XF Proliferation Medium

1. Thaw bottles of NeuroCult™-XF Proliferation Supplement overnight at 2 - 8°C or for 1 - 2 hours at 37°C. If not used immediately, aliquot into 10 mL volumes and store at -20°C. Avoid repeated freeze-thaw cycles.

*Note: If the supplement thawed during shipping, immediately aliquot and store at -20°C. If the supplement remained cool (not more than ~10°C), performance should be unaffected.*

2. Add the entire volume (50 mL) of NeuroCult™-XF Proliferation Supplement to one bottle (450 mL) of NeuroCult™-XF Basal Medium.

OR

Add 1 mL NeuroCult™-XF Proliferation Supplement to each 9 mL NeuroCult™-XF Basal Medium.

3. Mix thoroughly. NeuroCult™-XF Proliferation Medium without cytokines is now ready for use.

*Note: If not used immediately, store at 2 - 8°C for up to 1 month. Avoid repeated exposure of medium to room temperature and light.*

*Note: NeuroCult™-XF Proliferation Medium without cytokines is only used in very specific steps in the procedure, e.g. when resuspending and washing cell suspensions. Do not use this cytokine-free medium for cell culture.*

4. To each 10 mL NeuroCult™-XF Proliferation Medium without cytokines (i.e. NeuroCult™-XF Basal Medium containing NeuroCult™-XF Proliferation Supplement), add the following:
  - 20 µL of xeno-free 10 µg/mL EGF (to give a final concentration of 20 ng/mL EGF)
  - 10 µL of xeno-free 10 µg/mL bFGF (to give a final concentration of 10 ng/mL bFGF)
  - 10 µL of Heparin Solution\* (to give a final concentration of 0.0002% Heparin (w/v); equals 2 µg/mL)

*\*Heparin Solution contains non-human animal-derived components and can be omitted if a complete xeno-free system is desired.*

This will be known hereafter as **Complete NeuroCult™-XF Proliferation Medium**.

*Note: If not used immediately, store Complete NeuroCult™-XF Proliferation Medium (cytokine-containing) at 2 - 8°C for up to 2 weeks.*

### 2.1.5 Coating Cultureware for Adherent Monolayer Cultures

To culture neural stem and progenitor cells as adherent monolayers, an appropriate substrate is required to coat the surface of the cultureware. By coating the surface of the cultureware with poly-D-lysine (PDL), laminin, poly-L-ornithine, or combinations of these substrates, cell-to-substrate attachment is promoted, rather than cell-to-cell attachment, which results in aggregation and formation of neurospheres.

#### Preparation of 100 µg/mL PDL Stock Solution

1. Dissolve 5 mg poly-D-lysine in 50 mL sterile water.
2. Aliquot solution in polypropylene vials and store at 2 - 8°C.

#### Preparation of 10 µg/mL Laminin Stock Solution

1. Thaw laminin at 2 - 8°C, to prevent laminin from gelling.
2. Prepare a 10 µg/mL working solution of laminin by diluting the laminin in sterile PBS or sterile water (the amount prepared should correspond to the amount needed for immediate use).
3. Store the remaining laminin (undiluted) in appropriately sized working aliquots at -20°C.

#### Preparation of PDL/Laminin-Coated Cultureware

1. Dilute the 100 µg/mL PDL stock solution with sterile water to a final concentration of 10 µg/mL.
2. Dispense the appropriate volume of 10 µg/mL PDL solution for the chosen cultureware, as indicated in Table 3.

**Table 3. Recommended Substrate Volume for Coating Cultureware**

CULTUREWARE	VOLUME OF SUBSTRATE SOLUTION
6-well plate	1 - 2 mL/well
T-25 cm <sup>2</sup> flask	3 mL

3. Incubate at room temperature (15 - 25°C) for 2 hours or at 2 - 8°C overnight (~20 hours).
4. Wash each well/flask with sterile PBS, according to the recommended volumes in Table 4. Remove as much of the PBS as possible.

**Table 4. Recommended PBS Wash Volume**

CULTUREWARE	VOLUME OF PBS WASH BUFFER
6-well plate	1 - 2 mL/well
T-25 cm <sup>2</sup> flask	5 mL

5. Dispense 10 µg/mL laminin stock solution at the volume indicated in Table 3.
6. Incubate at room temperature for 2 hours or at 2 - 8°C overnight.
7. Wash each well/flask with sterile PBS, according to the recommended volumes in Table 4.  
*Note: Only remove the PBS when ready to plate the cells. Do not let the coated plates dry completely.*
8. The substrate-coated cultureware is ready for use. If not used immediately, wrap the plate with Parafilm® and store at 2 - 8°C for up to 2 weeks.
9. Proceed to section 4.0 for plating cells for adherent monolayer cultures.

PRODUCTS ARE FOR RESEARCH USE ONLY AND NOT INTENDED FOR HUMAN OR ANIMAL DIAGNOSTIC OR THERAPEUTIC USES UNLESS OTHERWISE STATED. FOR ADDITIONAL INFORMATION ON QUALITY AT STEMCELL, REFER TO [WWW.STEMCELL.COM/COMPLIANCE](http://WWW.STEMCELL.COM/COMPLIANCE).

### Preparation of Laminin-Only Coated Cultureware

1. Dispense 10 µg/mL laminin stock solution at the volume indicated in Table 3.
2. Incubate at room temperature (15 - 25°C) for 2 hours or at 2 - 8°C overnight.
3. Wash each well/flask with sterile PBS, according to the recommended volumes in Table 4.  
*Note: Only remove the PBS when ready to plate the cells. Do not let the coated plates dry completely.*
4. The substrate-coated cultureware is ready for use. If not used immediately, wrap the plate with Parafilm® and store at 2 - 8°C for up to 2 weeks.
5. Proceed to section 4.0 for plating cells for adherent monolayer cultures.

## 2.2 For Differentiation of Neural Stem and Progenitor Cells

### 2.2.1 Preparation of Complete NeuroCult™ Differentiation Medium

1. Thaw bottles of NeuroCult™ NS-A Differentiation Supplement (Human) at 2 - 8°C overnight or at 37°C for 1 - 2 hours. If not used immediately, aliquot into 10 mL volumes and store at -20°C. Avoid repeated freeze-thaw cycles.
2. Add the entire volume (50 mL) of NeuroCult™ NS-A Differentiation Supplement to one bottle (450 mL) of NeuroCult™ NS-A Basal Medium (Human).

OR

Add 1 mL NeuroCult™ NS-A Differentiation Supplement (Human) to every 9 mL NeuroCult™ NS-A Basal Medium (Human) (1 in 10 dilution).

3. Mix thoroughly. Complete NeuroCult™ Differentiation Medium is now ready for use.

*Note: If not used immediately, store Complete NeuroCult™ Differentiation Medium at 2 - 8°C for up to 1 month.*

### 2.2.2 Suggested Preparation for Xeno-Free Differentiation Medium

1. Add human serum to a final concentration of 2% to NeuroCult™-XF Proliferation Medium without cytokines (refer to section 2.1.4 steps 1 - 3).
2. Mix thoroughly. Complete Xeno-Free Differentiation Medium is now ready for use.

*Note: If not used immediately, store Complete Xeno-Free Differentiation Medium at 2 - 8°C for up to 1 month.*

### 2.2.3 Coating Cultureware for Differentiation Cultures

If using round glass coverslips for immunocytochemistry, ensure that the chosen coverslips can easily be added to and removed from the wells of the (e.g. 24-well) plate used for culturing the cells. Sterilize coverslips by autoclaving prior to coating with Matrigel®.

#### Matrigel®-Coated Glass Coverslips

Use either Corning Catalog #354277 (section 1) or Corning Catalog #354230 (section 2).

##### 1. Corning® Matrigel® hESC-Qualified Matrix (Corning Catalog #354277)

- a. Thaw Matrigel® at 2 - 8°C until it liquefies.  
*Note: To prevent gelation, Matrigel® must be kept cold (keep on ice or at 2 - 8°C).*
- b. Refer to the Matrigel® Certificate of Analysis for the recommended aliquot size ("Dilution Factor") to prepare 25 mL of diluted matrix.
- c. Aliquot the entire bottle of Matrigel® into 2 mL screw cap tubes. Set aside a sufficient number of aliquots for experimental use and store the remaining unused aliquots at -20°C.  
*Note: One Matrigel® aliquot generates enough solution to coat one or two 24-well plates (depending on whether 0.5 or 1 mL of solution is used to coat each well).*
- d. Add 25 mL of **cold** NeuroCult™ Proliferation Medium without cytokines (section **Error! Reference source not found.** steps 1 - 3) to a 50 mL polypropylene tube. Keep on ice.
- e. Transfer thawed Matrigel® to the tube prepared in step d. Pipette up and down to mix. The vial may be washed with cold medium if desired.
- f. Using sterile forceps, transfer one sterile glass coverslip per well of a 24-well plate.
- g. Add 0.5 - 1 mL of diluted Matrigel® to each well containing a coverslip.
- h. Incubate at room temperature (15 - 25°C) for 2 hours or overnight at 2 - 8°C.
- i. Remove the Matrigel® solution when ready to use the coated coverslips.  
*Note: Cells can be plated directly onto the Matrigel®-coated coverslips without the need for a wash step.*

Proceed to section 5.0 for plating cells for differentiation.

##### 2. Corning® Matrigel® Growth Factor Reduced (GFR) Basement Membrane Matrix (Corning Catalog #354230)

- a. Thaw Matrigel® at 2 - 8°C until it liquefies.  
*Note: To prevent gelation, Matrigel® must be kept cold (keep on ice or at 2 - 8°C).*
- b. The protein concentration of each lot of Matrigel® varies. Refer to the Matrigel® Certificate of Analysis to determine the appropriate volume of Matrigel® required to prepare 2 mg aliquots.
- c. Aliquot the entire bottle of thawed Matrigel® into 2 mg aliquots in 2 mL screw cap tubes. Set aside a sufficient number of 2 mg aliquots for experimental use and store the remaining unused aliquots at -20°C.  
*Note: One 2 mg Matrigel® aliquot generates enough solution to coat one or two 24-well plates (depending on whether 0.5 or 1 mL of solution is used to coat each well).*
- d. Add 23 mL of NeuroCult™ Proliferation Medium without cytokines (section **Error! Reference source not found.** steps 1 - 3) into a 50 mL polypropylene tube.
- e. Add 1 mL of **cold** NeuroCult™ Proliferation Medium without cytokines to the tube containing 2 mg Matrigel® and pipette up and down to mix the solution.
- f. Transfer the diluted Matrigel® solution to the 50 mL tube containing 23 mL NeuroCult™ Proliferation Medium without cytokines and pipette up and down gently to mix.

PRODUCTS ARE FOR RESEARCH USE ONLY AND NOT INTENDED FOR HUMAN OR ANIMAL DIAGNOSTIC OR THERAPEUTIC USES UNLESS OTHERWISE STATED. FOR ADDITIONAL INFORMATION ON QUALITY AT STEMCELL, REFER TO WWW.STEMCELL.COM/COMPLIANCE.

- 
- g. Using sterile forceps, transfer one sterile glass coverslip per well of a 24-well plate.
  - h. Add 0.5 - 1 mL of medium + Matrigel® (prepared in step e) to each well containing a coverslip.
  - i. Incubate at room temperature (15 - 25°C) for 2 hours or overnight at 2 - 8°C.
  - j. Remove the Matrigel® solution when ready to use the coated coverslips.

*Note: Cells can be plated directly onto the Matrigel®-coated coverslips without the need for a wash step.*

Proceed to section 5.0 for plating cells for differentiation.

## 3.0 Expansion of Neural Stem and Progenitor Cells in Neurosphere Cultures

### 3.1 Background

Neural stem cells (NSCs) can be isolated from different regions of the human embryonic and fetal CNS, including the striatum, cortex, spinal cord, thalamus, and ventral mesencephalon<sup>1</sup> at different stages of development. In the adult human brain NSCs reside within specific niches, such as the subventricular zone of the lateral ventricle.<sup>2</sup> Multipotent NSC-like cells, known as brain tumor stem cells (BTSCs) or cancer stem cells (CSCs), have been identified and isolated from different grades and types of brain cancers, including gliomas, medulloblastomas, astrocytomas, and ependymomas.<sup>3</sup> For information on the isolation of primary human CNS tissues, refer to “Cultures of Stem Cells from the Central Nervous System.”<sup>4</sup> All procedures must be performed in accordance with rules outlined by local ethics committees. The protocol below describes a method for expansion of human NSCs from primary tissues (obtained using standard microdissection techniques) in neurosphere cultures.

NeuroCult™ NS-A and NeuroCult™-XF (xeno-free) Proliferation Media are optimized for the culture of human neural stem and progenitor cells as cellular aggregates called neurospheres.

#### Important notes when culturing human neurospheres:

1. Overall, human NSCs have a slower growth rate than mouse NSCs; however, the growth rate is also highly dependent on the CNS region from which the cells are isolated. In optimized culture conditions human embryonic CNS cells (e.g. forebrain regions: telencephalon, diencephalon) exhibit a doubling time between 5 - 12 days, whereas mouse embryonic CNS cells only require 1 - 2 days.
2. Expansion of human embryonic CNS stem cells requires the presence of both epidermal growth factor (EGF) and basic fibroblast growth factor (bFGF).
3. Human neural stem cells are extremely sensitive to mechanical dissociation. To avoid excessive cell death, observe the following precautions and follow the Trituration procedure in section 3.3, step 4.
  - Do not allow neurospheres to overgrow, as it is more difficult to dissociate larger neurospheres. Neurospheres should not exceed 100 µm in diameter.
  - Always pre-wet the pipette tip with medium before drawing cells up, to prevent the cells from sticking to the walls of the tip.

### 3.2 Initial Plating of Primary Human CNS Cells in Neurosphere Cultures

1. Once CNS tissue has been separated from other tissues, dissected and processed to create a single-cell suspension, resuspend the cells in 1 mL Complete NeuroCult™ Proliferation Medium or Complete NeuroCult™-XF Proliferation Medium in a 15 mL polypropylene tube or 17 x 95 mm polystyrene tube.  
*Note: Use of polypropylene tubes is a precautionary step to prevent cell loss due to cells sticking to the plasticware.*
2. Using a pre-wetted disposable pipette tip attached to a 1 mL pipettor set at 0.99 mL, triturate the cell sample using a consistent rhythm approximately 20 - 30 times, or until a single-cell suspension is achieved.  
*Note: Do not expel the last volume of medium from the tip, as this will introduce air bubbles into the cell suspension, which will damage or kill cells.*
3. Add 1 mL Complete NeuroCult™ Proliferation Medium or Complete NeuroCult™-XF Proliferation Medium to the single-cell suspension and mix carefully to avoid creating any bubbles. Leave for approximately 1 minute to allow any undispersed pieces of tissue to settle.
4. Transfer the supernatant containing the single-cell suspension to a new sterile 15 mL tube.

PRODUCTS ARE FOR RESEARCH USE ONLY AND NOT INTENDED FOR HUMAN OR ANIMAL DIAGNOSTIC OR THERAPEUTIC USES UNLESS OTHERWISE STATED. FOR ADDITIONAL INFORMATION ON QUALITY AT STEMCELL, REFER TO [WWW.STEMCELL.COM/COMPLIANCE](http://WWW.STEMCELL.COM/COMPLIANCE).

5. Centrifuge at 192 x g for 10 minutes. Discard the supernatant.
6. Add 1 mL Complete NeuroCult™ Proliferation Medium or Complete NeuroCult™-XF Proliferation Medium and resuspend cells with a brief trituration (pipette up and down 2 times) using a 1 mL pipettor set at 0.99 mL.
7. Measure the total volume of the cell suspension. Count viable cells using Trypan Blue and a hemocytometer.
8. Seed cells at a density of  $5 \times 10^4$  viable cells/cm<sup>2</sup> in Complete NeuroCult™ Proliferation Medium or Complete NeuroCult™-XF Proliferation Medium as indicated in Table 5.

**Table 5. Recommended Primary Human CNS Cell Plating Conditions for Neurosphere Cultures**

CULTUREWARE	VOLUME OF MEDIUM	CELL DENSITY	TOTAL CELLS
6-well plate	3 mL/well	$5 \times 10^4$ viable cells/cm <sup>2</sup>	$4.75 \times 10^5$ cells
T-25 cm <sup>2</sup> flask	6 mL	$5 \times 10^4$ viable cells/cm <sup>2</sup>	$1.25 \times 10^6$ cells
T-75 cm <sup>2</sup> flask	10 mL	$5 \times 10^4$ viable cells/cm <sup>2</sup>	$3.75 \times 10^6$ cells

9. Incubate cultures at 37°C and 5% CO<sub>2</sub> in a humidified incubator.
10. Monitor the condition of the cultures daily (e.g. morphology of neurospheres, cell density, medium depletion, etc.). Viable neurospheres generally appear semi-transparent and phase bright, with many of the cells on the outer surface displaying microspikes. Refer to section 7.1 for representative images of cultured neurospheres.
11. Replenish the medium every 2 days until the cells are ready for subculture. To replenish the medium, add 0.5 mL (T-25 cm<sup>2</sup>) or 1 mL (T-75 cm<sup>2</sup>) fresh Complete NeuroCult™ Proliferation Medium or Complete NeuroCult™-XF Proliferation Medium. Do not exceed the volume capacity of the flasks (i.e. 11 mL for T-25 cm<sup>2</sup> flask or 21 mL for T-75 cm<sup>2</sup> flask).

### 3.3 Passaging Cells from Neurosphere Cultures

Neurospheres should be passaged when they reach approximately 100 - 150 µm in diameter (typically occurs 7 - 14 days after plating, although in some cases it may take up to 21 days), to avoid generating hypoxic cells in the centre of the spheres. Passaging should also be performed before the cells reach high densities and prior to the growth medium becoming acidic (turns orange/yellow in color). If the medium does turn orange/yellow in color before the neurospheres have reached 100 - 150 µm in diameter, perform a half-medium change.

*Note: Do not let the neurospheres grow too large (> 200 µm diameter); the cells within the core of large neurospheres lack appropriate gas and nutrient/waste exchange, and will become necrotic.*

1. Harvest and collect the entire cell suspension from the culture into a 50 mL tube (if using a T-75 cm<sup>2</sup> or T-162 cm<sup>2</sup> flask), or a 15 mL tube (if using a T-25 cm<sup>2</sup> flask), depending on the volume harvested. If neurospheres are attached to the culture flask, tap the culture flask or shoot a stream of medium across the attached cells to detach them. Pool all of the cells and medium into the same tube.

*Note: Use of polypropylene is precautionary, to prevent cell loss due to cells sticking to the plasticware.*

2. Centrifuge at 192 x g for 10 minutes.
3. Remove supernatant, leaving behind approximately 0.2 mL (200 µL) medium.
4. Triturate neurospheres using a 200 µL pipettor as follows:
  - a. Adjust the volume on the 200 µL pipettor to 180 µL, to avoid expelling the entire cell suspension and producing bubbles. Setting the pipette to a volume less than 180 µL will not provide efficient

PRODUCTS ARE FOR RESEARCH USE ONLY AND NOT INTENDED FOR HUMAN OR ANIMAL DIAGNOSTIC OR THERAPEUTIC USES UNLESS OTHERWISE STATED. FOR ADDITIONAL INFORMATION ON QUALITY AT STEMCELL, REFER TO [WWW.STEMCELL.COM/COMPLIANCE](http://WWW.STEMCELL.COM/COMPLIANCE).

mechanical force to dissociate all of the neurospheres. Resuspend cells in a maximum volume of 200  $\mu$ L.

- b. Angle the tube and pipette tip at 45°, however, do not press the tip against the side or bottom of the tube as this will create too much force on the cells during expulsion. Triturate the neurospheres by pipetting up and down 50 - 100 times in a firm, but not too vigorous, consistent rhythm.
  - c. Rinse the side of the tube during trituration to remove the remaining neurospheres that are attached to the side of the tube; however, do not rinse too high above the cell suspension volume.
  - d. Once the cells appear to be in a single-cell suspension (i.e. no obvious cell aggregates detected by eye), observe an aliquot of the cell suspension on a hemocytometer, to determine if any cellular aggregates remain.
  - e. Repeat the trituration procedure an additional 25 - 35 times, if needed, to dissociate cellular aggregates. A homogenous single-cell suspension should be present at this point.
5. Measure the total volume of the cell suspension. Count viable cells using Trypan Blue and a hemocytometer.
  6. Seed cells at a density of  $1 \times 10^4$  viable cells/cm<sup>2</sup> in Complete NeuroCult™ Proliferation Medium or Complete NeuroCult™-XF Proliferation Medium as indicated in Table 6.

**Table 6. Recommended Subculture Plating Conditions for Neurosphere Cultures**

CULTUREWARE	VOLUME OF MEDIUM	CELL DENSITY	TOTAL # OF CELLS
6-well plate	3 mL/well	$1 \times 10^4$ viable cells/cm <sup>2</sup>	$9.5 \times 10^4$ cells
T-25 cm <sup>2</sup> flask	6 mL	$1 \times 10^4$ viable cells/cm <sup>2</sup>	$2.5 \times 10^5$ cells
T-75 cm <sup>2</sup> flask	10 mL	$1 \times 10^4$ viable cells/cm <sup>2</sup>	$7.5 \times 10^5$ cells

7. Incubate cultures at 37°C and 5% CO<sub>2</sub> in a humidified incubator.
8. Monitor cultures daily. Medium should be replenished every 2 days after plating, as described in section 3.2 step 11.

*Note: Depending on the culture conditions and the CNS region from which the cells were obtained, a two-fold or greater expansion of total cells should be observed by the end of the culture period.<sup>1</sup>*

## 4.0 Expansion of Neural Stem and Progenitor Cells in Adherent Monolayer Cultures

### 4.1 Background

Neural stem cells (NSCs) can be isolated from different regions of the human embryonic and fetal CNS including the striatum, cortex, spinal cord, thalamus, and ventral mesencephalon<sup>1</sup> at different stages of development. In the adult human brain NSCs reside within specific niches, such as the subventricular zone of the lateral ventricle.<sup>2</sup> Multipotent NSC-like cells, known as brain tumor stem cells (BTSCs) or cancer stem cells (CSCs), have been identified and isolated from different grades and types of brain cancers, including gliomas, medulloblastomas, astrocytomas, and ependymomas.<sup>3</sup> For information on the isolation of primary human CNS tissues refer to “Cultures of Stem Cells from the Central Nervous System.”<sup>4</sup> All procedures must be performed in accordance with rules outlined by local ethics committees. The protocol below describes a method for expansion of human NSCs from primary tissues (obtained using standard microdissection techniques) in adherent monolayer cultures.

### 4.2 Initial Plating of Primary Human CNS Cells in Adherent Monolayer Cultures

1. Once CNS tissue has been separated from other tissues, dissected and processed to create a single-cell suspension, resuspend the cells in 1 mL Complete NeuroCult™ Proliferation Medium or Complete NeuroCult™-XF Proliferation Medium in a 15 mL polypropylene tube or 17 x 95 mm polystyrene tube.

*Note: Use of polypropylene is precautionary, to prevent cell loss due to cells sticking to the plasticware.*

2. Using a pre-wetted disposable pipette tip attached to a 1 mL pipettor set at 0.99 mL, triturate the cell sample using a consistent rhythm approximately 20 - 30 times, or until a single-cell suspension is achieved.

*Note: It is extremely important not to expel the last volume of medium from the tip as this will introduce air bubbles into the cell suspension, which will damage or kill cells.*

3. Add 1 mL Complete NeuroCult™ Proliferation Medium or Complete NeuroCult™-XF Proliferation Medium to the single-cell suspension and mix carefully to avoid creating any bubbles. Leave for approximately 1 minute to allow any undispersed pieces of tissue to settle.
4. Transfer supernatant containing the single-cell suspension to a new sterile 15 mL tube.
5. Centrifuge at 192 x g for 10 minutes. Discard the supernatant.
6. Add 1 mL Complete NeuroCult™ Proliferation Medium or Complete NeuroCult™-XF Proliferation Medium and resuspend cells with a brief trituration (pipette up and down 2 times) using a 1 mL pipettor set at 0.99 mL.
7. Measure the total volume of the cell suspension. Count viable cells using Trypan Blue and a hemocytometer.
8. Seed cells at a density of  $5 \times 10^4$  viable cells/cm<sup>2</sup> in Complete NeuroCult™ Proliferation Medium or Complete NeuroCult™-XF Proliferation Medium into **cultureware coated with PDL/laminin or laminin** as indicated in Table 7. For coating instructions see section 2.1.5.

**Table 7. Recommended Primary Human CNS Cell Plating Conditions for Adherent Cultures**

CULTUREWARE	VOLUME OF MEDIUM	CELL DENSITY	TOTAL # OF CELLS
6-well plate	3 mL/well	$5 \times 10^4$ viable cells/cm <sup>2</sup>	$4.75 \times 10^5$ cells
T-25 cm <sup>2</sup> flask	10 mL	$5 \times 10^4$ viable cells/cm <sup>2</sup>	$1.25 \times 10^6$ cells

9. Incubate cultures at 37°C and 5% CO<sub>2</sub> in a humidified incubator.

*Note: In the presence of a substrate, neural stem and progenitor cells will adhere to the substrate-coated cultureware within 24 hours. The attached cells show a flattened morphology and are mostly bipolar.*

### 4.3 Passaging Cells from Adherent Monolayer Cultures

Passage cultures when they reach 60 - 80% confluence.

*Note: Before harvesting the cells, it is important to prepare the required number of coated wells or flasks needed for subculture.*

The procedure outlined below uses ACCUTASE™ to dissociate the cells. ACCUTASE™ dissociation results in high cell viability and dissociated cells with the ability to initiate new adherent cultures for multiple passages.

- Remove the medium from the cultureware using a pipette.
- Add PBS to wash the cells as follows:
  - One well of a 6-well plate: 3 mL PBS
  - T-25 cm<sup>2</sup> flask: 10 mL PBS
- Swirl the culture plate or flask gently, then remove PBS and discard.
- Add ACCUTASE™ as follows:
  - One well of a 6-well plate: 0.5 mL ACCUTASE™
  - T-25 cm<sup>2</sup> flask: 1 mL ACCUTASE™
- Incubate at room temperature (15 - 25°C) or 37°C for 5 minutes.
- Observe the culture to determine if the cells are starting to detach and detachment is complete. If cells have not completely detached after 5 minutes, shoot a stream of medium across the surface of the cultureware to detach the cells (refer to steps 7 and 8 below).
- Add Complete NeuroCult™ Proliferation Medium or Complete NeuroCult™-XF Proliferation Medium to the detached cells using a disposable pipette, as follows:
  - One well of a 6-well plate: 2 mL medium
  - T-25 cm<sup>2</sup> flask: 5 mL medium
- Using the same pipette, resuspend the detached cells by pipetting the cell/medium suspension up and down 2 - 3 times.
- Collect the cells and place in a new sterile 15 mL tube. If cells remain in the vessel, add a small volume of Complete NeuroCult™ Proliferation Medium or Complete NeuroCult™-XF Proliferation Medium and repeat the procedure to collect the remaining cells.
 

*Note: Use of polypropylene is precautionary, to prevent cell loss due to cells sticking to the plasticware.*
- Centrifuge at 110 x g for 5 minutes.

PRODUCTS ARE FOR RESEARCH USE ONLY AND NOT INTENDED FOR HUMAN OR ANIMAL DIAGNOSTIC OR THERAPEUTIC USES UNLESS OTHERWISE STATED. FOR ADDITIONAL INFORMATION ON QUALITY AT STEMCELL, REFER TO WWW.STEMCELL.COM/COMPLIANCE.

11. Remove the supernatant. Resuspend cells in a maximum of 200  $\mu$ L Complete NeuroCult™ Proliferation Medium or Complete NeuroCult™-XF Proliferation Medium with a plastic disposable pipette tip attached to a 200  $\mu$ L pipettor set at 180  $\mu$ L. Pipette up and down until a single-cell suspension is achieved.
12. Add an appropriate volume (approximately 0.5 - 1 mL) of Complete NeuroCult™ Proliferation Medium or Complete NeuroCult™-XF Proliferation Medium.
13. Measure the total volume of the cell suspension. Count viable cells using Trypan Blue and a hemocytometer.
14. Seed cells at a density of  $1 \times 10^4$  viable cells/cm<sup>2</sup> in Complete NeuroCult™ Proliferation Medium or Complete NeuroCult™-XF Proliferation Medium into **cultureware coated with PDL/laminin or laminin** as indicated in Table 8. For coating instructions see section 2.1.5.

**Table 8. Recommended Subculture Plating Conditions for Adherent Cultures**

CULTUREWARE	VOLUME OF MEDIUM	CELL DENSITY	TOTAL # OF CELLS
6-well plate	3 mL/well	$1 \times 10^4$ viable cells/cm <sup>2</sup>	$9.5 \times 10^4$ cells
T-25 cm <sup>2</sup> flask	10 mL	$1 \times 10^4$ viable cells/cm <sup>2</sup>	$2.5 \times 10^5$ cells

15. Incubate cultures at 37°C and 5% CO<sub>2</sub> in a humidified incubator. This procedure can be repeated for multiple passages.

## 5.0 Differentiation of Neural Stem and Progenitor Cells

In the presence of cytokines (EGF and bFGF) neural stem cells remain in a relatively undifferentiated state. Upon removal of the cytokines and addition of a small amount of serum, neural stem and progenitor cells are induced to differentiate into neurons, astrocytes, and oligodendrocytes.

### 5.1 Harvesting Cells from Neurosphere Cultures for Differentiation

To initiate differentiation, single cells obtained from dissociated neurospheres should be cultured on Matrigel®-coated round glass coverslips in 24-well plates.

Harvest neurospheres 7 - 10 days after plating; at this stage, neurospheres will be approximately 100 µm in diameter.

*Note: Before harvesting the cells, it is important to prepare the required number of coated coverslips needed for subculture.*

1. Collect neurospheres and place in a sterile 15 mL polypropylene tube or 17 x 95 mm polystyrene tube.  
*Note: Use of polypropylene is precautionary, to prevent cell loss due to cells sticking to the plasticware.*
2. Centrifuge at 192 x *g* for 10 minutes.
3. Remove supernatant and discard.
4. Wash the cells to remove the cytokines by gently resuspending the cell pellet in 10 mL Complete NeuroCult™ Differentiation Medium or Complete Xeno-Free Differentiation Medium using a 10 mL disposable plastic pipette.
5. Centrifuge at 192 x *g* for 10 minutes.
6. Remove supernatant, leaving behind approximately 200 µL of the medium. Using a 200 µL pipettor set at 180 µL, triturate the neurosphere suspension (according to the instructions in section 3.3, step 4) until a single-cell suspension is achieved.
7. Measure the total volume of the cell suspension. Count viable cells using Trypan Blue and a hemocytometer.

### 5.2 Harvesting Cells from Adherent Monolayer Cultures for Differentiation

Harvest cells when the culture is 60 - 80% confluent.

To initiate differentiation, single cells obtained from adherent monolayer cultures should be cultured on Matrigel®-coated round glass coverslips in 24-well plates.

*Note: Before harvesting the cells, it is important to prepare the required number of coated coverslips needed for subculture.*

1. Remove medium from the cultureware using a pipette.
2. Add PBS to wash the cells as follows:
  - One well of a 6-well plate: 3 mL PBS
  - T-25 cm<sup>2</sup> flask: 10 mL PBS
3. Swirl the culture plate or flask gently, then remove PBS and discard.
4. Add ACCUTASE™ as follows:
  - One well of a 6-well plate: 0.5 mL ACCUTASE™
  - T-25 cm<sup>2</sup> flask: 1 mL ACCUTASE™

5. Incubate at room temperature (15 - 25°C) or 37°C for 5 minutes.
6. Observe the culture to determine if detachment is complete. If cells have not completely detached after 5 minutes, shoot a stream of medium across the surface of the cultureware to detach the cells (refer to steps 7 and 8 below).
7. Wash the cells to remove the cytokines by adding Complete NeuroCult™ Differentiation Medium or Complete Xeno-Free Differentiation Medium. Using a disposable pipette add medium to the detached cells as follows:
  - One well of a 6-well plate: 2 mL medium
  - T-25 cm<sup>2</sup> flask: 5 mL medium
8. Using the same pipette, resuspend the detached cells by pipetting the cell/medium suspension up and down 2 - 3 times.
9. Collect the cells and place in a new sterile 15 mL tube. If cells remain in the vessel, add a small volume of Complete NeuroCult™ Differentiation Medium or Complete Xeno-Free Differentiation Medium and repeat the procedure to collect the remaining cells.
 

*Note: Use of polypropylene is precautionary, to prevent cell loss due to cells sticking to the plasticware.*
10. Centrifuge at 110 x g for 5 minutes. Remove the supernatant.
11. Resuspend cells in a maximum of 200 µL Complete NeuroCult™ Differentiation Medium or Complete Xeno-Free Differentiation Medium using a plastic disposable pipette tip attached to a 200 µL pipettor set at 180 µL. Pipette up and down until a single-cell suspension is achieved.
12. Add an appropriate volume (approximately 0.5 - 1 mL) of Complete NeuroCult™ Differentiation Medium or Complete Xeno-Free Differentiation Medium.
13. Measure the total volume of the cell suspension. Count viable cells using Trypan Blue and a hemocytometer.

### 5.3 Plating Cells for Differentiation

1. Resuspend cells in Complete NeuroCult™ Differentiation Medium or Complete Xeno-Free Differentiation Medium to yield a plating cell density of 4.2 - 5.3 x 10<sup>4</sup> cells/cm<sup>2</sup>.
2. Seed cells onto Matrigel®-coated round glass coverslips in 24-well plates or onto Matrigel®-coated plates as indicated in Table 9.

**Table 9. Recommended Plating Conditions for Differentiation**

CULTUREWARE	VOLUME OF MEDIUM	CELL DENSITY	TOTAL # OF CELLS
24-well plate with Matrigel®-coated glass coverslips	1 mL	4.2 - 5.3 x 10 <sup>4</sup> cells/cm <sup>2</sup>	0.8 - 1 x 10 <sup>5</sup> cells
Matrigel®-coated 24-well plate	1 mL	4.2 - 5.3 x 10 <sup>4</sup> cells/cm <sup>2</sup>	0.8 - 1 x 10 <sup>5</sup> cells

3. Incubate cultures at 37°C and 5% CO<sub>2</sub> in a humidified incubator.
4. Monitor cultures daily, to determine if the medium needs to be changed during the differentiation procedure. If the medium becomes acidic (turns yellow), perform a half-medium change by removing approximately half of the medium and replacing with fresh Complete NeuroCult™ Differentiation Medium or Complete Xeno-Free Differentiation Medium.
5. Cultures should be examined after 5 - 10 days with an inverted light microscope to determine if the cells have differentiated (attached). Viable cells appear phase contrast bright. If differentiated cells are present, cells can be processed for indirect immunofluorescence as described in section 6.0.

PRODUCTS ARE FOR RESEARCH USE ONLY AND NOT INTENDED FOR HUMAN OR ANIMAL DIAGNOSTIC OR THERAPEUTIC USES UNLESS OTHERWISE STATED. FOR ADDITIONAL INFORMATION ON QUALITY AT STEMCELL, REFER TO [WWW.STEMCELL.COM/COMPLIANCE](http://WWW.STEMCELL.COM/COMPLIANCE).

## 6.0 Immunolabeling to Identify Differentiated Cell Types

### 6.1 Fixation

1. Remove approximately 90% of the culture medium from each well of a 24-well plate.  
*Note: Do not remove all of the culture medium prior to fixation; do not expose the unfixed cells to air.*
2. Working in a chemical fume hood, add 1 mL of 4% paraformaldehyde (in PBS, pH 7.2) to each well.
3. Incubate at room temperature (15 - 25°C) for 30 minutes.
4. Working in a chemical fume hood, remove the paraformaldehyde solution.
5. Add 1 mL PBS (pH 7.2) to each well and incubate at room temperature for 5 minutes. Remove PBS.
6. Repeat the PBS wash procedure 2 more times for a total of 3 washes. Remove PBS.

### 6.2 Permeabilization

1. Add 1 mL of 0.3% Triton™ X-100 (in PBS) to each well.
2. Incubate at room temperature for 5 - 10 minutes.
3. Remove Triton™ X-100/PBS.
4. Add 1 mL PBS (pH 7.2) to each well and incubate at room temperature for 5 minutes. Remove PBS.
5. Repeat the PBS wash procedure 2 more times for a total of 3 washes. Remove PBS.

### 6.3 Blocking and Labeling with Primary Antibodies

1. Prepare the blocking solution of 10% serum in PBS. The type of serum used should correspond to the animal in which the secondary antibody was generated.
2. Dilute the primary antibody in blocking solution (containing the appropriate serum) to give an appropriate dilution for immunolabeling. A minimum volume of 250 µL should be added to each well.\*  
*Note: For a complete list of available antibodies, visit [www.stemcell.com](http://www.stemcell.com) or contact us at [techsupport@stemcell.com](mailto:techsupport@stemcell.com).*
3. Add diluted primary antibodies to the desired wells of a 24-well plate.
4. Incubate at 37°C for 2 hours or at 2 - 8°C overnight.
5. Wash off the primary antibodies with 3 x 5-minute PBS washes. Remove PBS.

### 6.4 Secondary Labeling

1. Dilute secondary antibodies in PBS + 2% serum (the same serum used for preparing the blocking solution) to give an appropriate dilution for immunolabeling. Add a minimum volume of 250 µL to each well containing differentiated cells labeled with primary antibodies.
2. Incubate secondary antibodies at 37°C for 30 minutes or at 2 - 8°C overnight.  
*Note: Fluorophore-conjugated secondary antibodies are sensitive to light; keep samples in the dark to prevent bleaching.*
3. Wash off the secondary antibody with 3 x 5-minute PBS washes. Remove PBS.
4. Add distilled water to each well.

\* Alternatively, a small volume of antibody (approximately 50 µL) can be added directly on the coverslip containing the differentiated cells and a second clean coverslip can be placed directly on top.

PRODUCTS ARE FOR RESEARCH USE ONLY AND NOT INTENDED FOR HUMAN OR ANIMAL DIAGNOSTIC OR THERAPEUTIC USES UNLESS OTHERWISE STATED. FOR ADDITIONAL INFORMATION ON QUALITY AT STEMCELL, REFER TO [WWW.STEMCELL.COM/COMPLIANCE](http://WWW.STEMCELL.COM/COMPLIANCE).

## 6.5 Mounting

1. Add 10  $\mu$ L mounting medium (e.g. FluorSave™ Reagent, EMD Millipore Catalog #345789) to a clean glass coverslip. Remove immunolabeled coverslip from the 24-well plate and gently tap the corner of the coverslip to remove excess water.
2. Place coverslip cell-side-down onto the mounting medium. Avoid trapping any air bubbles.
3. Visualize immunolabeling under a fluorescent microscope using the appropriate filters for each fluorophore. Refer to section 8.0 for representative images of immunolabeled differentiated cells.

## 7.0 Representative Images of Neural Stem and Progenitor Cell Cultures

### 7.1 Neurosphere Cultures

**A - B.** Neurospheres derived from human CNS cells observed after being cultured for 10 days in Complete NeuroCult™ Proliferation Medium. Neurospheres measure approximately 100 - 200  $\mu\text{m}$  in diameter, are phase contrast bright, semi-transparent, and have small microspikes on the periphery of the spheres (arrows). Magnification: 10X (**A**) and 40X (**B**).

*Note: Human CNS-derived neurospheres cultured in NeuroCult™-XF Proliferation Medium display similar morphology.*

### 7.2 Adherent Monolayer Cultures

**A - B.** Adherent monolayer cultures of human CNS-derived neural stem and progenitor cells cultured in Complete NeuroCult™ Proliferation Medium on tissue culture plates coated with 10  $\mu\text{g}/\text{mL}$  laminin.

**A.** Day 10 of in vitro culture of passage 10 cells (~80 - 85% confluent).

**B.** Day 16 of in vitro culture of passage 11 cells (~60% confluent). Magnification: 10X.

## 8.0 Representative Images of Immunofluorescent Staining to Identify Differentiated Cells Obtained from Neurospheres

**A.** Neurons (red) were detected with a mouse monoclonal  $\beta$ -tubulin III antibody. Magnification: 10X.

**B.** Astrocytes (green) were detected with a rabbit polyclonal GFAP antibody. Magnification: 20X.

**C.** Immature oligodendrocytes (purple) were detected with a rabbit monoclonal O4 Oligodendrocyte Marker antibody. Magnification: 20X.

**D.** Mature oligodendrocytes (purple) were detected with a galactocerebroside antibody. Magnification: 20X.

**A - D.** Neurospheres derived from human CNS tissue were cultured in NeuroCult™ Proliferation Medium. Prior to initiating differentiation, neurospheres were dissociated and plated on coverslips. NeuroCult™ Differentiation Medium was used to promote differentiation of neural stem and progenitor cells to neurons, astrocytes, and oligodendrocytes.

*Note: Cells obtained from neurospheres cultured in NeuroCult™-XF Proliferation Medium and differentiated under xeno-free differentiation conditions display similar immunofluorescent staining patterns when treated with the same antibodies.*
